Such a treatise should cover the entire field of heating and ventilation in a simplified form and should contain such tables as are commonly used in every day practice. This book aims to fulfill such a need and is intended to supplement other more specialized works. The principles presented are the same as those that have been stated many times before, but the arrangement of the work, the applications and the designs are all original. Many formulas and rules are necessarily given; but it will be seen that, in most cases, they are developments from a few general formulas, all of which can be readily understood and remembered. Practical points in constructive design have also been considered. However, since the principles of heating and ventilation are founded upon fundamental thermodynamic laws, it seems best to accentuate the theoretical side of the work in the belief that if this is well understood, practical points of experience will easily follow. A pamphlet containing suggestions and problems for a course of instruction in technical schools is included with every book. It is hoped that the material here given will be simple enough for the beginner...
